

Well Status Fluid Type Determination

Status Changes In Well Life Cycle

Some oil well GORs will be expected to increase with decreasing oil rates over the life of the well. These wells will generally continue to be classified as oil once the well status has been previously determined.

Gas wells that begin to produce significant quantities of oil in the life of the well (>5 average m³/d and 1800 or less GOR) will be reviewed for a potential change to oil status.

Sufficient Production Data

Final determination of well status will only occur with sufficient full production hours, with valid and representative classified liquid analysis. Horizontal stimulated wells may require more than six months in some cases to accurately determine the well status.
